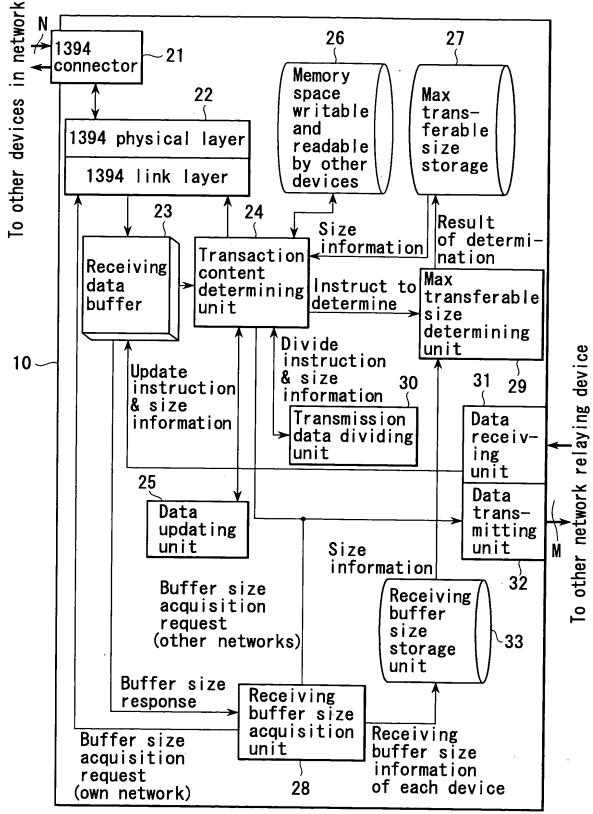

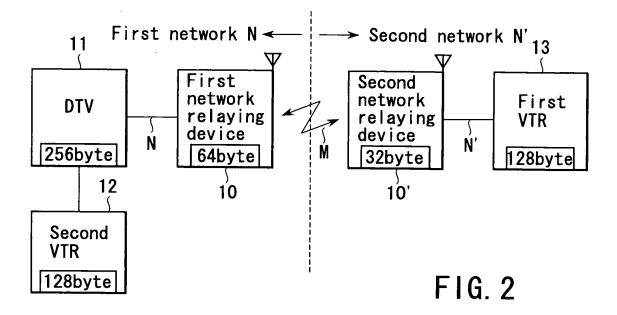

FIG. 1

Associated network	Device	Size	
First network	First relayer	64 bytes	
First network	DTV	256 bytes	
First network	Second VTR	128 bytes	
Second network	Second relayer	32 bytes	
Second network	First VTR	128 bytes	

FIG. 3

Device	Object device		Available size
DTV	Second network	First VTR	32 bytes
Second VTR	Second network	First VTR	32 bytes

FIG. 4

Switch on power or reset bus Receiving buffer size acquisition unit acquire -S11 and hold receiving buffer size Upon receipt of request packet and upon determination that the request packet is aimed at investigating receiving buffer size, transaction content determining -S12 unit specify transmitting— and receiving—side devices and give instruction to determine max transferable size Max transferable size determining unit determine that minimum one of receiving buffer sizes of transmitting -side devices, transmitting-side relaying device, ·S13 receiving-side device and receiving-side relaying device, as maximum transferable data size Transaction content determining unit transfer request packet to receiving-side device via receiving-side -S14 relaying device Transfer response packet from receiving-side device via receiving-side relaying device to transmitting-side -S15 relaying device in accordance with request packet Upon determination by transmitting-side relaying device that response packet responds to previous request packet, transaction content determining unit acquire -S16 max transferable size between transmitting- and receiving-side devices from max transferable size storage unit Transaction content determining unit give update instruction to data updating unit, and data updating S17 unit update max transferable size based on size information acquired Transfer response packet with updated max transferable -S18 size to receiving-side updating unit Receiving-side device having received response packet transmit by dividing the response packet appropriately -S19 to suit updated max transferable size FIG. 5

End

Switch on power or reset bus)

Receiving buffer size acquisition unit acquire **S21** and hold max command size from devices Upon receipt of request packet and upon determination that the request packet is aimed at investigating max command size usable for transmission and receiving of command contained in command set used for various **S22** protocols, transaction content determining unit specify transmitting- and receiving-side devices and instruct max transferable size determining unit to determine max transferable size Max transferable size determining unit determine that minimum one of max command sizes of transmitting-side devices, transmitting-side relaying device. **S23** receiving-side device and receiving-side relaying device, as maximum transferable data size Transaction content determining unit transfer request packet to receiving-side device via receiving-side **S24** relaying device Transfer response packet from receiving-side device via receiving-side relaying device to transmitting-side S25 relaying device in accordance with request packet Upon determination by transmitting-side relaying device that response packet responds to previous request packet, transaction content determining unit acquire ~S26 max transferable size between transmitting- and receiving-side devices from max transferable size storage unit Transaction content determining unit give update instruction to data updating unit, which update max ~ S27 transferable size based on size information acquired Transfer response packet with updated max transferable **- S28** size to receiving-side updating unit Receiving-side device having received response packet transmit by dividing the response packet appropriately -S29 to suit updated max transferable size
